The Top Artificial Intelligence Tools to Grow Your Business

SHOKWORKS

Artificial Intelligence, or AI, has made the jump from science fiction to being part of our everyday reality. We included AI in our list of tech trends taking over 2020. Our minds tend to go to the sci-fi cliché when we hear the term but AI isn't here to replace your team. The following tools will make your team more effective and productive.

1. Lead Scoring

Predictive lead scoring takes the guesswork and grueling data-entry out of traditional lead scoring. Traditionally sales and marketing teams would create broad customer profiles and lead scores aren't tainted by human error. A salesperson can score a lead but without the complete data including the salespersons strategy this score is not universal to the entire company.

AI can analyze leads and put the high conversion leads front and center for your team increasing morale and revenue. AI can present this potential client to your sales team

with a full profile to influence their strategy and approach for a higher chance of success. AI automation tools can determine if a lead has gone cold so your team can focus on the right opportunities. Low score deals don't necessarily mean all is lost. AI can address the problem and suggests solutions to convert the lead by matching them with the right salesperson.

2. SEO Strategy

You are most likely already implementing some sort of SEO strategy of title tags and content creation. AI ensures these efforts aren't wasted and your team spends the hours creating effective content. Data is mined in real time and the amount of data is beyond what any human could enter. Using AI your copy team will be equipped with optimized keywords and topics backed by predictive data trends. Your content will not only have more views, but it will be the views will be tailored to your intended audience.

3. E-Commerce Shopping Carts

As a consumer shopping online you have definitely interacted with the E-Commerce AI functions. If you're anything like us you've experienced first-hand the effectiveness of at least one of these AI tools. Online "carts" are abandoned at a rate of 75.6% and on mobile phones the average rate is even higher. Whether it's wanting to sleep on a big purchase, not having their payment information ready or just plain distraction over \$4 Trillion worth of items fill abandoned carts. These carts gone cold aren't gone forever. AI technology is able to reach out to customers about their abandoned items via email including when those items go on sale in the future. With a 48% open rate these emails are proven effective is getting customers back on your site.

4. Customer Service Chatbots

According to Microsoft 47% of consumers abandon brands because of bad customer service. Two complaints most people have are wait times and a flawed voice menu (shouting Operator into the phone is so popular it's a tv trope). AI provides simple easy solutions to both problems. Chatbots can reach your customers right away 24 hours a day either via the site chat function or social media platforms like Twitter and Facebook. Chatbots make the customers interaction feel more personal and organic, instead of selecting from menus they can describe their situation in seconds. AI enabled chatbots

interpret the customers context, spelling errors and tone for the best experience. For more complicated issues chatbots can easily transfer the data to a live representative ready to help without the frustration of repeating information. Chatbots are able to resolve between 25% and 50% of problems quickly and to consumer satisfaction. Keep up brand loyalty and have happy customers by introducing chatbots.
