Breaking down DevSecOps

DevSecOps is an overwhelming term but we're here to break it down for you and explain why it matters. DevSecOps breaks down into three parts Dev — Development Sec — Security Ops — Operations; Development Security Operations. Similar to Mobile First, DevSecOps is a development strategy that prioritizes a feature the early stages. In this case it is integrating strong security into all stages of development, preventing and anticipating any problems before they are able to occur.

How does it work? Is it different than DevOps?

DevOps is a term that's been around a bit longer and you may be familiar with it — development operations. It is a much simpler concept it is the integration of developers and IT while creating a product instead of being separate. This includes security but DevSecOps takes the concept a step further to not just incorporating security but making it a priority.

The old way of doing things was a linear process where the product would be passed team to team like an assembly line. Developers would send the product to IT for security testing who would send it to QA teams and so on until it is released to operations. The DevSecOps structure is a cyclical workflow incorporating all teams in unison which saves time and makes your project more Agile.

Why does it matter?

As we just explained, DevSecOps makes your enterprise more agile. Instead of siloed steps that take you back to the beginning at every challenge your teams work together to fix problems in real time, together. The shift to automation and AI bring new threats but also new opportunities to be as secure as possible. Automated testing can be integrated into app development with DevSecOps preventing breeches before they happen by keeping up with continuous updates. Any application developed in the culture of DevSecOps will give your clients and end users confidence that their data is safe.
